Background

Spleen Tyrosine Kinase (SYK) is a key activator of signaling pathways downstream of multiple surface receptors implicated in asthma. SYK function has been extensively studied in Last cells downstream of the high-affinity IgE receptor (FcεR1). Most studies evaluating SYK function in preclinical models have relied on poorly selective compounds, anti-sense oligonucleotides, or SYK knockout mice. Here we describe the characterization of SYK mechanism in multiple *in vivo* model settings.

Materials and methods

The effect of SYK inhibitor MRK-A on allergic airway responses was evaluated in IgE-mediated tracheal extravasation in rat, Brown Norway Ova rat models of allergic inflammation and the sheep inhaled ascaris allergen challenge model.

Results

MRK-A dose-dependently blocked IgE-mediated tracheal extravasation in rat. In a Brown Norway rat ovalbumin-sensitized airway challenge model oral dosing of MRK-A led to a dose-dependent inhibition of airway inflammation. Intravenous dosing of MRK-A was able to significantly inhibit both early and late allergen-induced changes in airway resistance in an ascaris-sensitive sheep allergen challenge model as well as airway hyper responsiveness.

Conclusions

Here we demonstrated that SYK mechanism plays a significant role in several *in vivo* allergen challenge models. This ranges from simple PK/PD mast cells driven models

such as the IgE-mediated tracheal extravasation to the more complex and clinically relevant sheep inhaled allergen challenge model.
